Welsh Assembly Government

PARTICIPATION RATES FOR WELSH STUDENTS IN HIGHER EDUCATION WITHIN THE UK DURING 2000/2001

■ INTRODUCTION

- 1 This report is the fourth in a series of reports published by the Higher Education Funding Council for Wales (HEFCW) to provide information about the levels of participation in higher education in Wales. This report presents the student participation rates in the academic year 2000/01.
- 2 The report follows the same structure as the three previous reports (W00/34HE, W00/108HE & W02/29HE), presenting information on participation rates in higher education (HE) in a series of maps. Most of the analysis is displayed by unitary authority, and these maps show how participation levels vary with age, mode of study and gender. For readers requiring more detailed local level data the report additionally includes a series of maps showing the participation rates at Ward (i.e., Electoral Division) level.
- 3 Context statistics regarding both the higher education sector in Wales and student participation trends between the academic years 1998/99 and 2000/01 are provided in the tables of Annex A.

■ BACKGROUND

- 4 A key educational priority of the National Assembly and the HEFCW is to increase the number of higher education students from neighbourhoods where the proportion of the population studying within the higher education sector (i.e., the participation rate) is traditionally very low.
- 5 The published performance indicators for UK Higher Education Institutions (HEFCE publications 00/40, 01/69 & 2002/52) show that Wales performs well in comparison with the rest of the UK in providing access to higher education for people from disadvantaged areas. However, in order to maintain and improve on this position it is necessary to analyse and review periodically the patterns of participation across Wales, as well as to encourage institutions to target students from low participation areas through incentives such as funding premiums for widening access and other initiatives.
- 6 This report presents a snapshot of the distribution of the domicile of Welsh HE students within UK higher education institutions (including the Open University), and further education colleges, in 2000/01. The analysis is based on data collected by the Higher Education Statistics Agency (HESA), the three GB Further Education Funding Councils and the Department of Employment and Learning (DEL) in Northern Ireland.

■ THE METHODOLOGY

- 7 The participation rates in this report are presented according to either the 22 Unitary Authorities of Wales or the 908 Electoral Wards used in the 1991 Census. Each Welsh student's Ward and Unitary Authority of domicile was derived from the postcode of the student's home address. The student participation rates for these areas could most simply be defined as the number of higher education students from the area divided by the resident population. However, such a definition of participation does not lead to figures which can be fairly compared between regions due to the difference in regional population, sex and age profiles.
- 8 To take account of the different sex and age profiles of a local area, the Welsh national participation rates, aggregated by age and sex, were used to calculate the number of higher education students that could be **expected** to come from any particular Ward or Unitary Authority. The expected

number of students for an area is the number of students that would be domiciled in that area if the participation patterns mirrored those for all of Wales.

- 9 The **Standard Participation Rate** which is used throughout this report allows regional participation rates to be fairly compared to each other. It is defined as the number of higher education students domiciled in an area divided by the expected number of students for that area (as defined in para. 8), and multiplied by 100. The higher the Standard Participation Rate the greater the uptake of the population within the higher education sector.
- 10 If a particular region has a Standard Participation Rate (SPR) of less than 100 then there were fewer HE students living in that area than would be expected based on the Welsh national averages. Similarly, a SPR value above 100 indicates a region with a larger percentage of the population studying for a higher education qualification than would be expected from the national averages.
- 11 The participation rate data used in generating the maps and tables in this report have taken account of:
 - students returning invalid or missing postcodes;
 - census data amendments to locate students at their home addresses;
 - first results of 2001 Population Census;
 - statistical 'noise' in areas with low student populations.

Further technical details of the calculation methods used are given in Annex B.

■ WELSH HIGHER EDUCATION STUDENTS

- 12 In 2000/01 there were over 101,000 Welsh domiciled students studying for higher education qualifications in HE institutions and further education colleges in the UK. Seventy per cent of these students were studying in Wales (including Open University students). Of all the Welsh domiciled students over half (56 per cent) were female. Similarly, just over half of all students were full-time undergraduates and of these the majority were under 25 years old. However, of the 45 per cent of Welsh students studying on a part-time basis most were 25 years of age or older. A breakdown of the mode, gender, level and age of Welsh students is provided in Tables 1 to 4 of Annex A.

■ WELSH NATIONAL PARTICIPATION RATES

- 13 The calculated national participation rates for 2000/01 are shown in Table 5 of Annex A. Over 3 per cent of the Welsh population was engaged in higher education in 2000/01 with the participation of Welsh women in higher education significantly higher than that of men. The participation rates were highest for 18 to 19 year olds, with over one quarter studying for a higher education qualification.
- 14 The percentage of the population engaged in higher education rose between 1998/99 and 2000/01 as student numbers increased. The increase was not uniform across all age categories; Table 5 shows how the national participation rates increased over the three years by both gender and age.

■ INTERPRETING THE MAPS

- 15 The maps in this report, broken down by Unitary Authorities (Maps 1-8) and Census Wards (Maps 9-12), have been drawn on the same fixed ranges of Standard Participation Rate so as to allow comparison between maps. Areas coloured in yellow show regions where the participation within higher education was closely in line with the national average. Areas which are either red or orange had participation rates significantly below the national average, whilst areas in green had high levels of participation in higher education.

- 16 In each map legend the number of Unitary Authorities or Wards which fall into each participation range are shown in parentheses.

■ COMMENTARY ON MAPS

Overview

- 17 The maps of Standard Participation Rates (SPRs) in this report show that there were significant variations in levels of participation in higher education in 2000/01, both in terms of Unitary Authorities and Census Wards. Residents of certain Unitary Authorities were found to be two or three times as likely to be studying in higher education than residents of other Unitary Authorities. On a Ward level residents of a ward with a very low participation rate were up to ten times less likely to be studying in higher education than residents of a ward with a very high participation rate.
- 18 In general, the regions which had the lowest Standard Participation Rates were located in the South Wales Valleys. Nearly 45 per cent of the wards in Wales considered to have very low participation levels lie in the South Wales Valleys (Blaenau Gwent, Bridgend, Caerphilly, Torfaen, Merthyr Tydfil and Rhondda Cynon Taff), whilst in total the South Wales Valleys account for only 19 per cent of all Welsh wards (see Maps 9 to 12). The highest Student Participation Rates were found in Ceredigion, although other regions such as Monmouthshire, Carmarthenshire and Conwy also had very high participation rates.

Participation by student mode of attendance

- 19 The Standard Participation Rates for Welsh domiciled higher education students by mode of attendance were analysed by means of full-time and part-time study, shown in Maps 2 and 3 respectively. In these maps, postgraduate research students (PGR) have been excluded due to the different nature of their study. The participation rates for part-time students were somewhat more uniform across the country than those for full-time students (i.e., more Unitary Authorities had SPRs close to the national average).
- 20 Furthermore, when the students studying for low-credit courses were excluded from the analysis (Map 4), the national variation in part-time participation rates was shown to be even more uniform across the authorities of Wales. A student on a low-credit course was defined as a student who is studying for less than 10 per cent of a full time equivalent (FTE). The authority with the largest proportion of students enrolled on low-credit courses was Ceredigion with about 30 per cent of its part-time students on low-credit courses. (See Maps 3 & 4 and Table 7b from Annex A.)

Participation for full-time undergraduate students by age

- 21 Standard Participation Rates for full-time undergraduate students were analysed (Maps 5 and 6). Eighty five per cent of full-time undergraduates were under 25 and the participation levels for this age group varied widely across Wales with fairly high participation rates across much of Wales but these high rates were offset by very low rates in the south east of Wales and Wrexham. The participation rates for the full-time undergraduates aged 25 and over also varied widely across Wales but the distribution was quite different to that for young entrants, with very high rates in the north west of Wales and low rates in Powys and the South Wales Valleys.

Participation by student gender

- 22 The national participation rates for female students were significantly higher than those for male students (see para. 13). There was no strong regional component to the difference in numbers between male and female students, and both share a similar participation distribution across Wales. This can be seen in the similarities between Maps 7 and 8.

■ ETHNICITY

- 23 In the 2000/01 academic year 3 per cent (2,969) of the Welsh domiciled student population whose ethnicity was known were from ethnic minorities. The numbers of students from ethnic minorities living in each unitary authority varied from 25 in Anglesey to 1,010 in Cardiff. Due to the small numbers involved and the high concentration of ethnic minorities living in urban Cardiff, Swansea and Newport, it has not been possible to provide a meaningful map of participation rates broken down by ethnicity. However, it can be noted that the 2001 Labour Force Survey showed that only 1.9 per cent of the Welsh population aged 16 and over were from ethnic minorities. Therefore overall, ethnic minorities are well-represented within higher education. However, this picture is unlikely to be consistently true across all ethnic groups and ages, in all areas of Wales.

■ PARTICIPATION RATE TRENDS

- 24 Tables 6a-6d compare student Standard Participation Rates calculated for 1998/99 (as published in W00/108HE), 1999/2000 (as published in W02/29HE) and 2000/2001 data. As all three sets of figures are Standard Participation Rates which have been normalised to the yearly national average rates broken down by gender and age, it is misleading to compare the Standard Participation Rates from different years directly. However, the standard deviation (shown in the tables) can be used to measure the variation of participation rates across the country, where the larger the standard deviation the greater the variation in rates.
- 25 The national variation in student participation rates by area of domicile in 2000/2001 was higher than in 1998/1999. That is, between 1998/99 and 2000/01 there was a widening of the relative gap between areas of high participation and low participation. This trend is true for nearly all student groups examined but is particularly marked for young full-time students (Table 6c).
- 26 An illustration of the apparent widening gap in levels of participation can be seen from the figures in Table 7a. Between 1998/99 and 2000/01, the number of students from the high participation areas of Ceredigion, Monmouthshire, Conwy and Carmarthenshire rose by 19%. Over the same time period the number of students from the low participation areas of Blaenau Gwent, Caerphilly, Torfaen, Merthyr Tydfil and Wrexham rose by only 10%. So, although student numbers have increased across Wales the disparity between the growth rates has caused the gap between areas of high and low participation to widen.
- 27 Only when future year's participation data is available, will it be clear whether this apparent widening of the participation gap is an anomaly for 2000/01 or a genuine trend.

Map 1 : Standard Participation Rates for all Welsh Domiciled HE Students in 2000/2001

Unitary Authority	Standard Participation Rate	Unitary Authority	Standard Participation Rate
Isle of Anglesey	100	Neath Port Talbot	84
Gwynedd	113	Bridgend	87
Conwy	124	Vale of Glamorgan	117
Denbighshire	102	Rhondda Cynon Taff	85
Flintshire	97	Merthyr Tydfil	78
Wrexham	79	Caerphilly	70
Powys	116	Blaenau Gwent	54

ANNEX B : TECHNICAL DETAILS

■ PARTICIPATION RATES

- 1 The Department for Education and Skills (DfES) uses a participation rate in higher education, for trend examination and planning purposes, which is known as the Age Participation Index (API). The definition for the API is;

$$\frac{\text{The Number of Young (under 21) Full Time and Sandwich New Entrants}}{\text{The Average Number of 18 and 19 year olds in the Population}} \times 100 \quad (1)$$

- 2 Although the Age Participation Index has historically been used within the higher education sector to follow trends, it is clearly not an all inclusive participation rate, as by no means are all higher education new entrants either studying full-time or on sandwich courses, and neither are they predominantly young students arriving straight from school or sixth form college. By way of example, of the 37,600 new entrants to Welsh HEIs in the 2000/01 academic year, only 42 per cent were both studying full-time or sandwich courses and were younger than 21. What the API formula calculates is the chance of a young person going into higher education before they are 21, based on a snap-shot of the present year. Such a formula is useful for overall national trend analyses but provides only a partial picture as the part-time and mature student populations are excluded. These can be significant factors.
- 3 A broader definition of a student participation rate is one which gives the total number of students from a region as a proportion of the total population. To accommodate regional variations, this definition can be extended to take account of the age and gender profile of each region. Mathematically this can be described by the following formula;

$$\sum_{\text{all } x} \left(\frac{\text{Number of Students of sex / age } x}{\text{Number in Population of sex / age } x} \right) \times 100 \quad (2)$$

- 4 Equation (2) is both the formula used in the participation rates published by HESA in *Higher Education Management Statistics - Sector Level 2000/01* (October 2002), and is also the definition of participation rate employed by work commissioned by SHEFC in looking at Scottish HE students (*Participation in Higher Education in Scotland 1996-97*, Applied Statistics Group at Napier University). This report follows this approach, standardising the calculated rates for each of the 908 Welsh Census Wards according to the Welsh national participation rate. Not only is this in line with the above publications within the higher education sector but it is also similar to the approach taken in the health sector in the calculation of Standardised Mortality Ratios (SMRs).
- 5 In mathematical terms, the definition of “Standard Participation Rate” used within this report is;

$$\sum_{\text{all } x} \left(\frac{\text{Actual Number of Students in Ward of sex/ age } x}{\text{Expected Number of Students in Ward of sex / age } x} \right) \times 100 \quad (3)$$

where the,

$$\text{Expected Number of Students in Ward of sex / age } x = \left(\text{Population in Ward of sex / age } x \right) \times \left(\text{National Participation Rate of sex / age } x \right) \quad (4)$$

and,

$$\text{National Participation Rate of sex / age } x = \frac{\text{Total number of Welsh Students of sex / age } x}{\text{Total Population of Wales of sex / age } x} \quad (5)$$

■ METHODS OF POSTCODE ANALYSIS

- 6 To arrive at standard participation rates for each of the 908 1991 census electoral wards in Wales, every student postcode must be mapped to its own particular ward. Out of 101,268 Welsh HE students it was found that 7 per cent had missing, unreadable or invalid postcodes.
- 7 Although a 93 per cent success rate at mapping students to 1991 Census Wards would seem high, the distribution of students with unidentified postcodes is not necessarily uniform across the wards of Wales and the missing data could therefore result in distortion of the participation rate profile. In fact, 26 per cent of the unidentified postcodes correspond to students studying at either the University of Wales, Bangor or Liverpool John Moores University. This clumping of missing data at a small number of institutions is clearly likely to lead to distortion and so Welsh wards have been assigned to these students with unidentifiable postcodes by assuming that they live in the same wards as fellow Welsh students from their particular institution. The students with unmapped postcodes are divided proportionately between the wards according to the profile of their fellow students.

■ PROBLEMS OF LOW WARD STUDENT POPULATIONS

- 8 The expected student population is defined in equation (4) as the national participation rate multiplied by the ward population, summed over all gender and age categories. A ward will have a low expected student population if either:
 - the total ward population is low, or
 - the number of young adults in the ward is low.
- 9 The low expected student populations occur predominantly in the rural areas of Wales. As a low expected student population can result in a large change in standard participation rate for a small change in student numbers, care must be taken with these wards. To alleviate this problem a coefficient is added to both the actual student populations and the expected student populations. This coefficient is calculated from the distribution of all the ward standard participation rates and has the effect of removing the “statistical noise” in the calculated standard participation rates without unreasonably distorting the nature of the data being used in the calculation.

■ RESIDENT POPULATIONS OF ELECTORAL WARDS

- 10 The wards used in this analysis are those of the 1991 Census. To derive participation rates it is necessary to have a breakdown of the local population, thus the data used in this analysis is split according to gender and 21 age categories.
- 11 The population figures used have been arrived at by combining Census based population data with population growth rate data. The base population data used was 1996 ward population estimates supplied by a commercial company. These 1996 population estimates were calculated by the application of various growth factors to the 1991 Census populations. As in previous analyses, NHS population data was used to “grow” the 1996 populations to generate estimates for the 1998 populations (see HEFCW circular

W00/108HE). Population growth rates between 1998/99 and 2000/01 were calculated, by gender, age group and Unitary Authority, using 1998 Mid-year population estimate data and Census 2001 data. These population growth rates were applied to the ward level 1998 population data in order to calculate 2000 population estimates. At the time of analysis full local area 2001 Census data was not available, however it is anticipated that future analysis will use the 2001 Census figures as the baseline population data.

- 12 The Census figures used locate students, as far as possible, at their home address and not at their term time address. This is essential in establishing meaningful small area participation rates.
